

Lec4: Introduction to Dynamic Routing Protocol

Routing Protocols and Concepts – Chapter 3

Cisco | Networking Academy®
Mind Wide Open™

Objectives

- Describe the role of **dynamic routing protocols** and **place these protocols in the context of modern network design**.
- Identify several ways to **classify routing protocols**.
- Describe how **metrics are used** by routing protocols and identify the **metric types** used by **dynamic routing protocols**.
- Determine the **administrative distance of a route** and describe its **importance** in the routing process.
- Identify the **different elements of the routing table**.

Dynamic Routing Protocols

- Function(s) of Dynamic Routing Protocols:
 - **Dynamically share** information between routers.
 - **Automatically update routing table** when topology changes.
 - **Determine best path** to a destination.

Routers Dynamically Pass Updates

Dynamic Routing Protocols

- The **purpose of a dynamic routing protocol** is to:
 - **Discover** remote networks
 - **Maintaining** up-to-date routing information
 - **Choosing the best path** to destination networks
 - Ability to **find a new best path** if the current path is no longer available

Routing Protocol Operation

Routing protocols are used to exchange routing information between the routers.

Dynamic Routing Protocols

■ Components of a routing protocol

– Algorithm

- In the case of a routing protocol algorithms are used for **facilitating routing information and best path determination**

– Routing protocol messages

- These are messages for **discovering neighbors and exchange of routing information**

Routing Protocol Operation

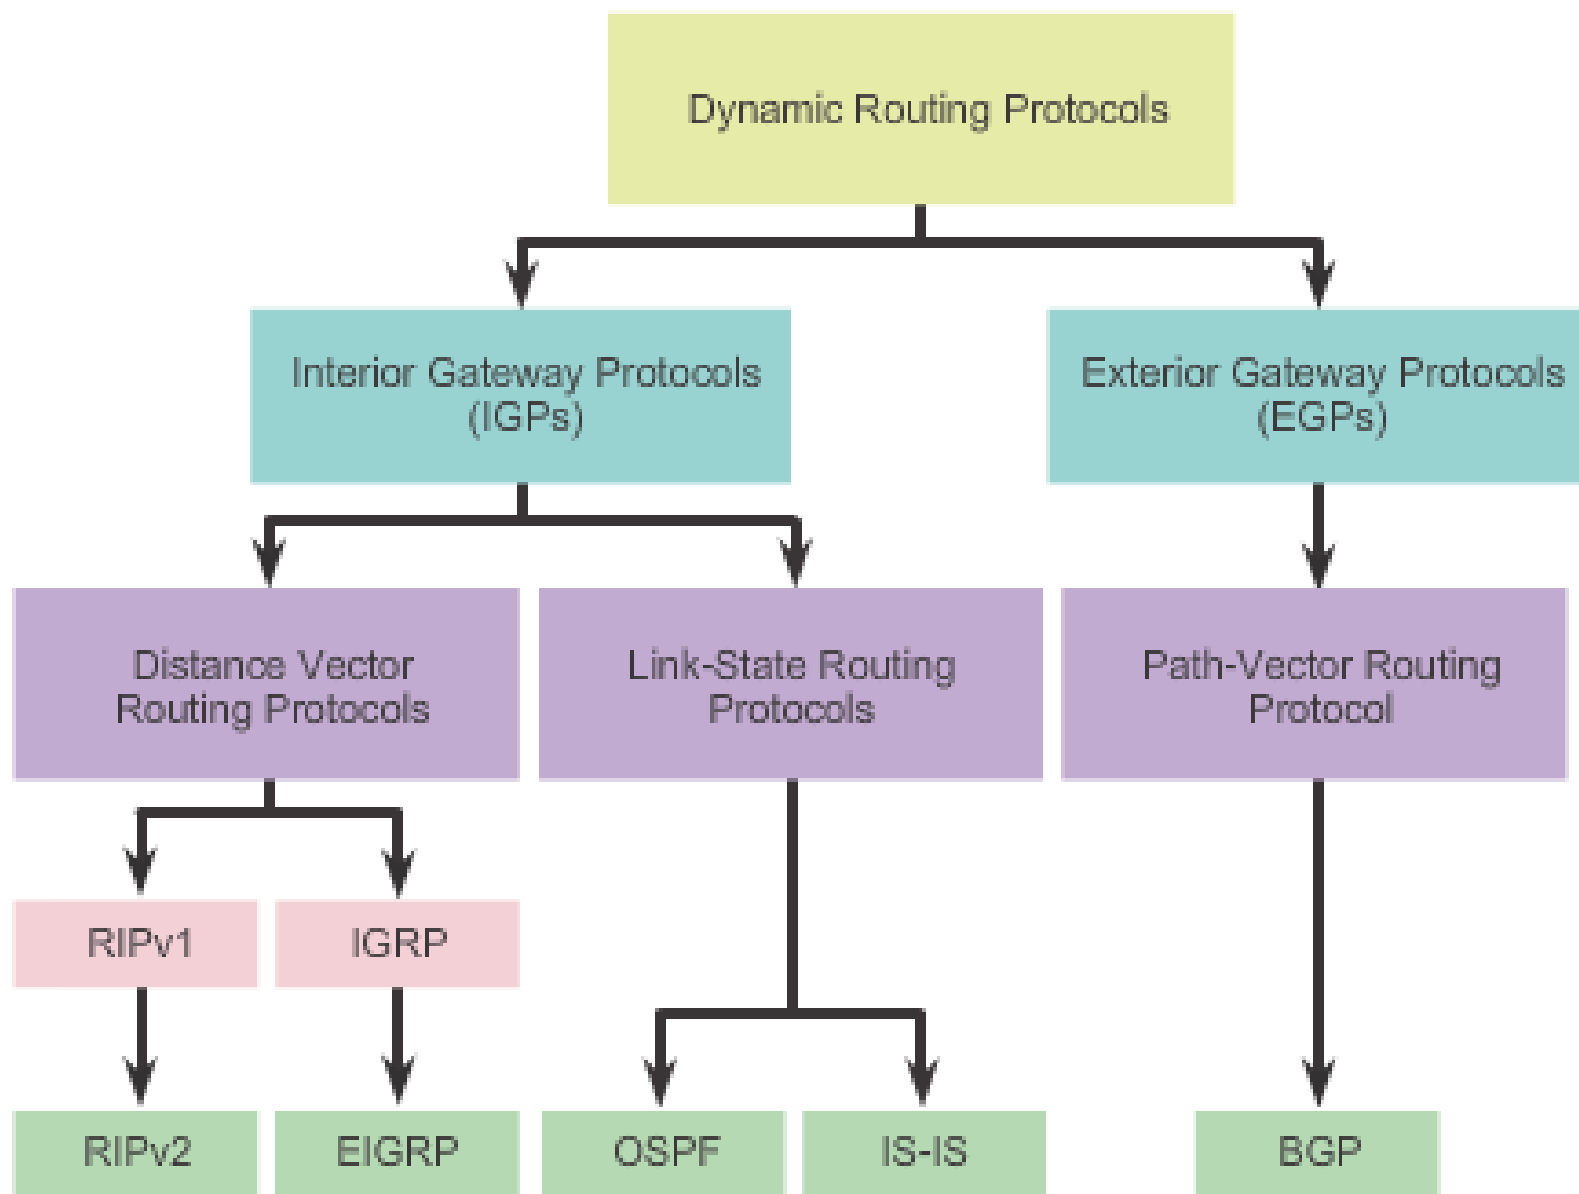

Routing protocols are used to exchange routing information between the routers.

Dynamic Routing Protocols

- Advantages of **static routing**
 - It can **backup multiple interfaces/networks** on a router
 - **Easy to configure**
 - **No extra resources** are needed
 - **More secure**
- Disadvantages of **static routing**
 - Network changes require **manual reconfiguration**
 - **Does not scale well** in large topologies

Routing Protocols Classification

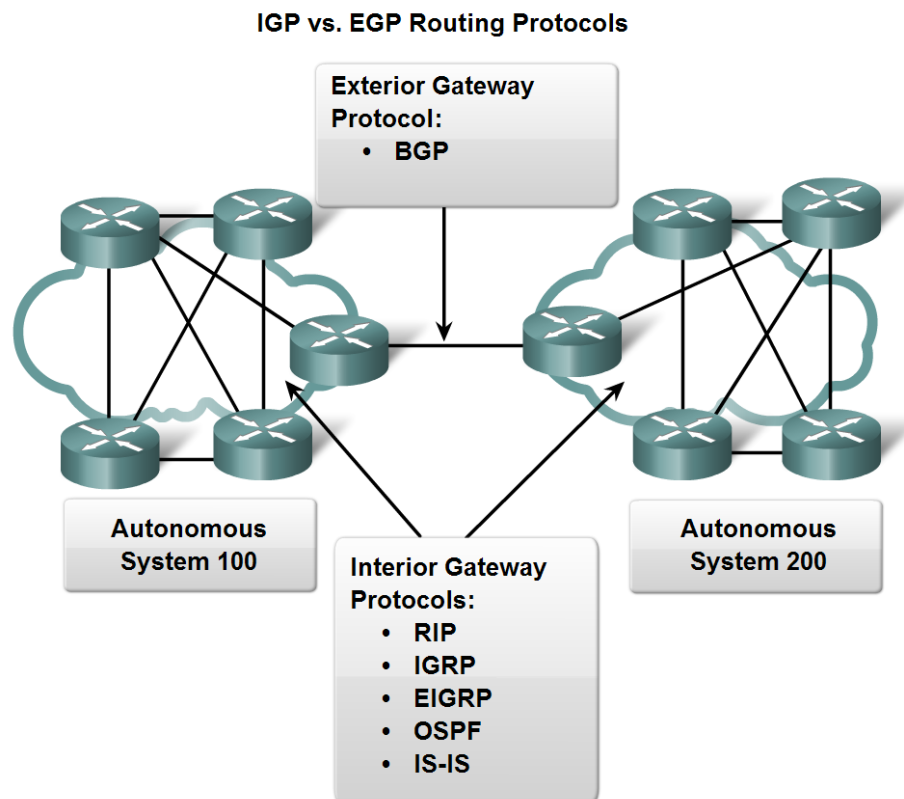

Classifying Routing Protocols

- **Dynamic routing protocols** are **grouped according to characteristics**. Examples include:
 - RIP
 - IGRP
 - EIGRP
 - OSPF
 - IS-IS
 - BGP
- **Autonomous System** is a group of routers and networks under the control of a **single authority**.

Classifying Routing Protocols

- **Types of routing protocols:**
 - **Interior Gateway Protocols (IGP)**
 - **Exterior Gateway Protocols (EGP)**

Classifying Routing Protocols

■ Interior Gateway Routing Protocols (IGP)

- Used for routing **inside an autonomous system** & used to route within the **individual networks themselves**
- Examples: RIP, EIGRP, OSPF

■ Exterior Routing Protocols (EGP)

- Used for routing **between autonomous systems**
- Example: BGPv4

Classifying Routing Protocols

■ IGP: Comparison of **Distance Vector** & **Link State** Routing Protocols

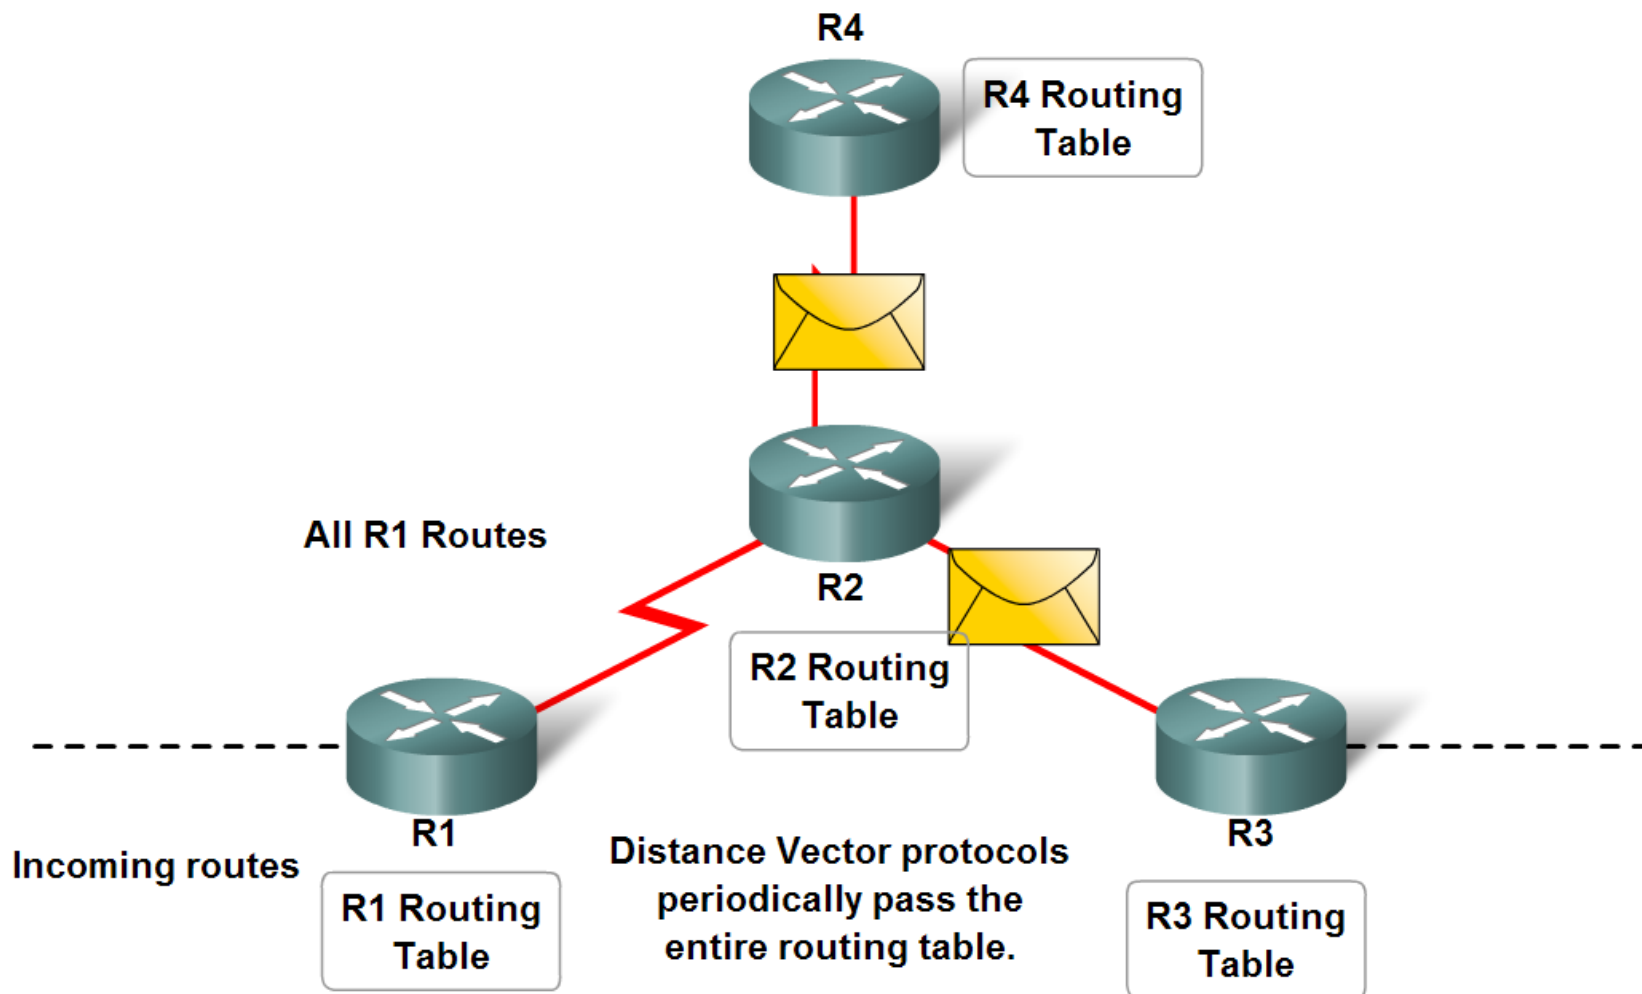

Distance vector

- Routes are advertised as vectors of distance & direction
- Incomplete view of network topology
- Generally, periodic updates

Link state

- Complete view of network topology is created
- Updates are not periodic

Distance Vector Protocol Operation

Link-state Protocol Operation

Link-state protocols pass updates when a link's state changes.

Classifying Routing Protocols

■ Classful routing protocols

- Do NOT send subnet mask in routing updates

Classful vs. Classless Routing

Classful: Subnet mask is the same throughout the topology

■ Classless routing protocols

- Do send subnet mask in routing updates

Classless: Subnet mask can vary in the topology

Classifying Routing Protocols

- **Convergence** is defined as when all routers' routing tables are at **a state of consistency**

Comparing Convergence

Slower Convergence: RIP and IGRP
Faster Convergence : EIGRP and OSPF

Routing Protocols Metrics

▪ Metric

- A value used by a routing protocol to **determine which routes are better than others**

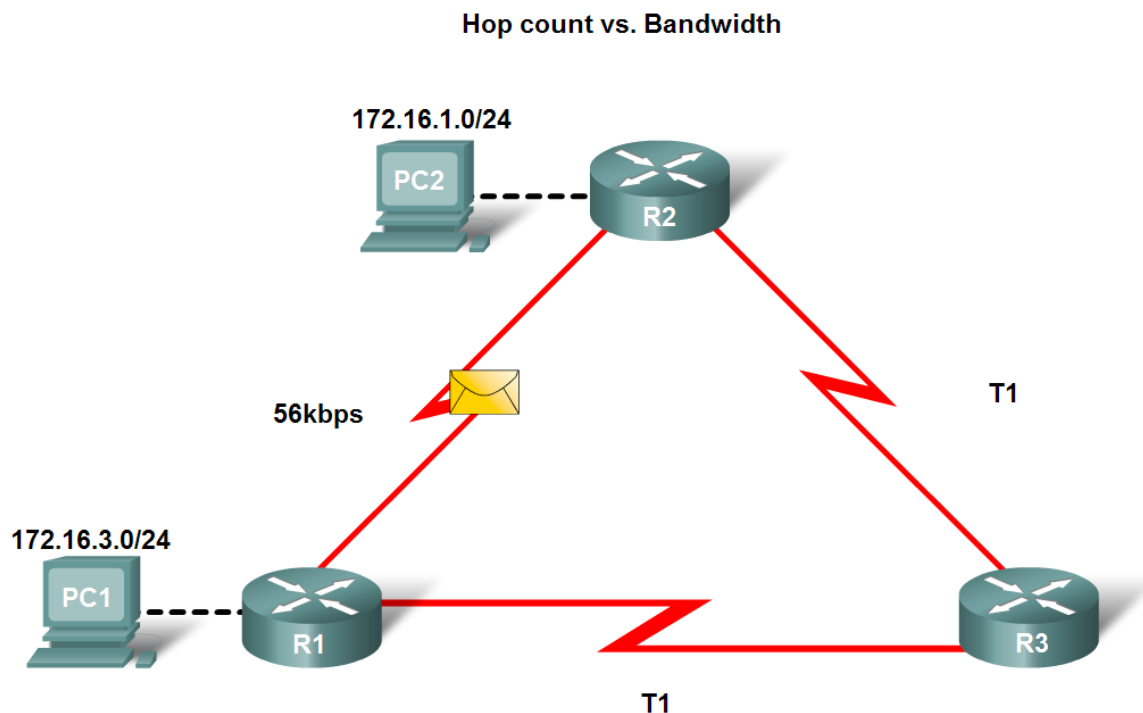

Metrics

Routing Protocols Metrics

■ Metrics used in IP routing protocols

- Bandwidth
- Cost
- Delay
- Hop count
- Load
- Reliability

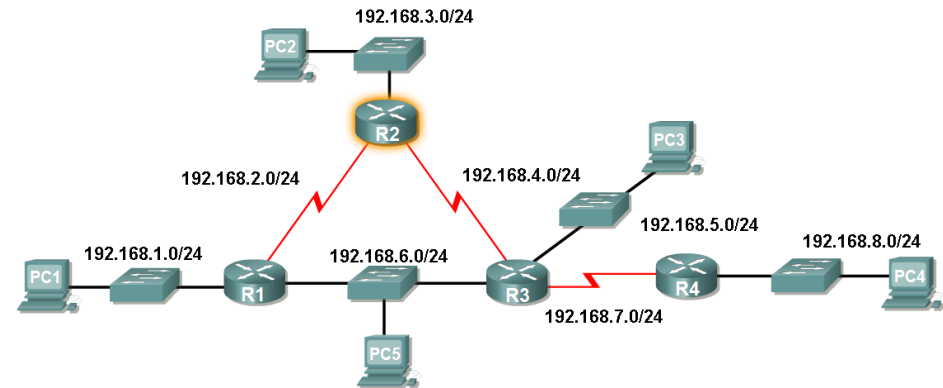

RIP chooses shortest path based on hop count.
OSPF chooses shortest path based on bandwidth.

Routing Protocols Metrics

- The Metric Field in the Routing Table
- **Metric** used for each routing protocol
 - RIP - hop count
 - IGRP & EIGRP - Bandwidth (used by default), Delay (used by default), Load, Reliability
 - IS-IS & OSPF - Cost, Bandwidth (Cisco's implementation)

Metric in the Routing Table

```
R2#show ip route
<output omitted>

Gateway of last resort is not set

R    192.168.1.0/24 [120/1] via 192.168.2.1, 00:00:24, Serial0/0
C    192.168.2.0/24 is directly connected, Serial0/0
C    192.168.3.0/24 is directly connected, FastEthernet0/0
C    192.168.4.0/24 is directly connected, Serial0/1
R    192.168.5.0/24 [120/1] via 192.168.4.1, 00:00:26, Serial0/1
R    192.168.6.0/24 [120/1] via 192.168.2.1, 00:00:24, Serial0/0
                                     [120/1] via 192.168.4.1, 00:00:26, Serial0/1
R    192.168.7.0/24 [120/1] via 192.168.4.1, 00:00:26, Serial0/1
R    192.168.8.0/24 [120/2] via 192.168.4.1, 00:00:26, Serial0/1
```

It is 2 hops from R2 to 192.168.8.0/24

Routing Protocols Metrics

▪ Load balancing

- This is the ability of a router to **distribute packets among multiple same cost paths**

Load Balancing Across Equal Cost Paths

```
R2#show ip route
<output omitted>

R    192.168.6.0/24 [120/1] via 192.168.2.1, 00:00:24, Serial0/0/0
                        [120/1] via 192.168.4.1, 00:00:26, Serial0/0/1
```

Administrative Distance of a Route

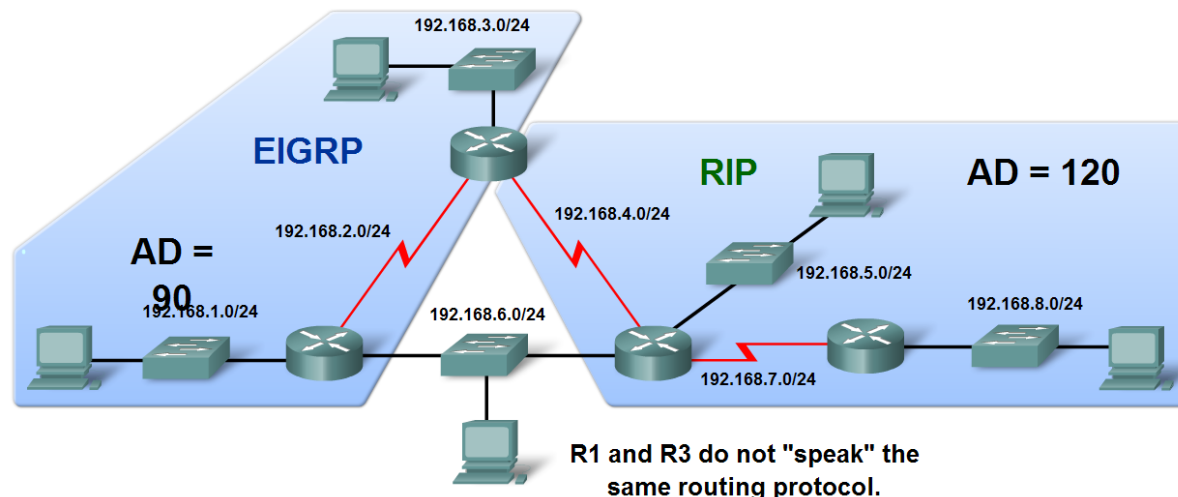

■ Purpose of a metric

- It's a calculated value **used to determine the best path** to a destination

■ Purpose of **Administrative Distance**

- It's a numeric value that **specifies the preference of a particular route**

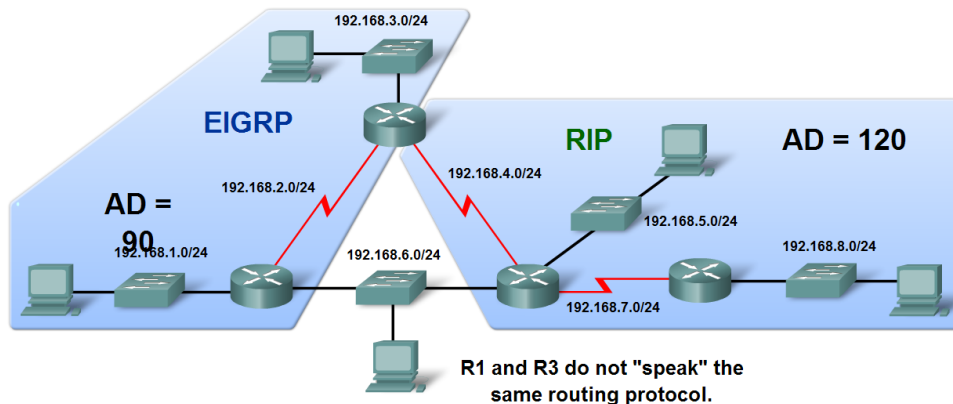

Comparing Administrative Distances

Administrative Distance of a Route

- Identifying the **Administrative Distance (AD)** in a routing table
 - It is **the first number in the brackets** in the routing table

Comparing Administrative Distances

```
R2#show ip route
(**output omitted**)
```

Gateway of last resort is not set

```
D 192.168.1.0/24 [90/2172416] via 192.168.2.1, 00:00:24, Serial0/0/0
C 192.168.2.0/24 is directly connected, Serial0/0/0
C 192.168.3.0/24 is directly connected, FastEthernet0/0
C 192.168.4.0/24 is directly connected, Serial0/0/1
R 192.168.5.0/24 [120/1] via 192.168.4.1, 00:00:08, Serial0/0/1
D 192.168.6.0/24 [90/2172416] via 192.168.2.1, 00:00:24, Serial0/0/0
R 192.168.7.0/24 [120/1] via 192.168.4.1, 00:00:08, Serial0/0/1
R 192.168.8.0/24 [120/2] via 192.168.4.1, 00:00:08, Serial0/0/1
```

```
R2#show ip rip database
```

```
192.168.3.0/24    directly connected, FastEthernet0/1
192.168.4.0/24    directly connected, Serial0/0/1
192.168.5.0/24
[1] via 192.168.4.1, Serial0/0/1
192.168.6.0/24
[1] via 192.168.4.1, Serial0/0/1
192.168.7.0/24
[1] via 192.168.4.1, Serial0/0/1
192.168.8.0/24
[2] via 192.168.4.1, Serial0/0/1
```

Administrative Distance of a Route

- Dynamic Routing Protocols

Route Source	Administrative Distance
Connected	0
Static	1
EIGRP summary route	5
External BGP	20
Internal EIGRP	90
IGRP	100
OSPF	110
IS-IS	115
RIP	120
External EIGRP	170
Internal BGP	200

Administrative Distance of a Route

- **Directly connected routes**
 - Have a default **AD of 0**
- **Static Routes**
 - Administrative distance of a static route has a **default value of 1**

```
R2#show ip route 172.16.3.0
Routing entry for 172.16.3.0/24
Known via "static", distance 1, metric 0 (connected)
  Routing Descriptor Blocks:
    * directly connected, via Serial0/0/0
      Route metric is 0, traffic share count is 1
```

Administrative Distance of a Route

▪ Directly connected routes

- Immediately appear in the routing table as soon as the interface is configured

```
R2#show ip route
```

```
Codes: C - connected, S - static, I - IGRP, R - RIP, M - mobile, B - BGP
```

```
D - EIGRP, EX - EIGRP external, O - OSPF, IA - OSPF inter area
```

```
N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
```

```
E1 - OSPF external type 1, E2 - OSPF external type 2, E - EGP
```

```
i - IS-IS, L1 - IS-IS level-1, L2 - IS-IS level-2, ia - IS-IS inter area
```

```
* - candidate default, U - per-user static route, o - ODR
```

```
P - periodic downloaded static route
```

```
Gateway of last resort is not set
```

```
172.16.0.0/24 is subnetted, 3 subnets
```

```
C      172.16.1.0 is directly connected, FastEthernet0/0
```

```
C      172.16.2.0 is directly connected, Serial0/0/0
```

```
S      172.16.3.0 is directly connected, Serial0/0/0
```

```
C      192.168.1.0/24 is directly connected, Serial0/0/1
```

```
S      192.168.2.0/24 [1/0] via 192.168.1.1
```

Summary

- **Dynamic routing protocols** fulfill the following **functions**
 - **Dynamically share information** between routers
 - **Automatically update routing table** when topology changes
 - **Determine best path** to a destination
- **Routing protocols are grouped as either**
 - **Interior gateway protocols (IGP) Or**
 - **Exterior gateway protocols(EGP)**
- **Types of IGPs include**
 - **Classless routing protocols** - these protocols include subnet mask in routing updates
 - **Classful routing protocols** - these protocols do not include subnet mask in routing update

Summary

- **Metrics** are used by dynamic routing protocols to calculate the best path to a destination
- **Administrative distance** is an integer value that is used to indicate a router's "trustworthiness"
- **Components of a routing table** include:
 - Route source
 - Administrative distance
 - Metric
